Synergy Zyklen

Rework of Existing Website: Allowing Independence

1.0 Introduction

1.1 Project Background

Synergy Zyklen Solution is a supplier and seller of consumer goods.

- Operates on a **sequential cycle-based model**
- Tracks all product units sold (company & consumers)
- Records each sale by date and time
- Each cycle has a defined number of units (e.g., 1–30)
- Automatically continues as long as eligible products are sold

Currently operates via a **WordPress-based website**.

The cycle system code was **“vibe coded”** by the manager (no coding background).

1.2 Problem Statement

- **WordPress limitations:** Plugins cause restrictions and require extra payment for certain features
- **Difficult to expand** business
- **Unreadable code:** Vibe coded by someone without coding experience
- **Not suitable for long-term use**
- **Resource-heavy:** Relies on math, no separate database to track ongoing cycles
- **Manual labor:** Manager manually inputs cashback into user wallets after each cycle
- **Risk of errors** due to manual input

1.3 Project Objective

The objective of this project is to:

1. **Allow the code to run independently** without the use of WordPress
2. **Rewrite the cycle code** for cleaner, more maintainable code
3. **Allow full automation** of the cycle and cashback rewards

2.0 Literature Review

(Nak letak apa?)

(Based on copyright?)

2.1 Feasibility Studies

(Still required?)

Main Concern

- Will GMI retain right to code?

- Will gmi allow outside stakeholder instead of own idea?
